

Abstract of the Disclosure

METHOD AND SYSTEM FOR PROVIDING END-USER VISUALIZATION

A process for simulating one or more components for a user is disclosed. The process may include creating an engineering model of a component, receiving selection data for configuring the component from a user, and creating a web-based model of the component based on the selection data and the engineering model. Further, the process may include performing a simulation of the web-based model in a simulation environment and providing, to the user, feedback data reflecting characteristics of the web-based model during the simulation.
